DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 1-9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hand et al (#5,902,011) in view of Nissen and Colasanti et al.

Hand et al (#5,902,011) show an article of furniture comprising a support (22) having a support surface, a flexible support member (30) having a plate structure, a plurality of air bladders (24), at least one fluid line coupling the air bladders together, and a single valve (34) fluidly coupled with at least one fluid line. However, Hand et al do not disclose that the air bladder has an expandable foam and the support member has outwardly extending opposed projections connecting to the support surface.

Nissen teaches a seat cushion comprising an open-celled compressible foam material. The cushion is self-inflating when the valve is open. A user can deflate the

cushion and then close the valve to prevent further inflation of the cushion. It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the bladders of Hand et al by enabling the bladders to have an expanded foam material to be self-inflating by an open valve, and then closing the valve to prevent further inflation as taught by Nissen. This modification would facilitate the process of inflating and deflating the bladders to accommodate a user's back.

Furthermore, Colasanti et al teach a lumbar support comprising a support (20) having a support surface and a flexible support member (42) having a plurality of outwardly extending projections (54,56) being of upper and lower segments. The upper and lower segments are connected to the support surface. It would have been obvious to one of ordinary skill in the art at the time the invention was made to construct the support member of Hand et al's invention with extending projections as taught by Colasanti et al, in order to securely attach the support member to the support surface of the support.

Allowable Subject Matter

Claims 19 and 21 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Remarks

The examiner has reviewed and considered the applicant's comments in the Amendment, filed on August 1, 2003. Based on an updated search, the examiner has decided to issue a new ground of rejection. Accordingly, this Office action is considered to be Non-final.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Chiba et al is cited as showing similar types of support.
